

1, Explain uses of ping command in network ?

Ping is used to check whether one device can reach another device over an IP network.
It uses ICMP (Internet Control Message Protocol)

2, Explain netbios protocol ?

Netbios - network basic input/output system.
It is mainly for communication and name resolution between computers on a local network.

3, Explain SMB protocol ?

SMB stands for server message block. It is a network protocol used for file and printer sharing between computers over a network.

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

When PC 50.0.0.10 pings 50.0.0.20, it generates an echo request. At Layer 3, the source and destination IP addresses are 50.0.0.10 and 50.0.0.20. At Layer 2, the source and destination MAC addresses are added to the Ethernet frame. The frame is then transmitted through the Physical Layer to the destination. The destination sends an ICMP Echo Reply back.
